

The Squiggly Ditch: A Case Study - Reclamation of an AML Highwall Using Geomorphic Techniques to Achieve a More Natural Landform, and Stable Drainage Without Riprap and Terraces

Dan Hause

Abstract: This presentation will discuss the rationale behind the design of an AML highwall backfill using geo-morphological principles. The area in question was designed previously using "conventional" design practices.

The job was bid this spring and the two designs were bid as alternatives to compare the cost of each. Construction is on-going as of this date.
